PGA (POLYGLYCOLIC ACID) SUTURES

PGA, absorbable material is preferred suture material for ocular surgery. PGA (polyglycolic acid) is a sterile, coated, braided, synthetic absorbable and ready to use suture composed of polyglycolic Acid.

PGA is a synthetic absorbable suture based on polyglycolic acid. PGA sutures, coated with polycaprolactone and calcium stearate, have been found to be inert, non antigenic and non pyrogenic. The sutures are available in dyed(violet) and undyed form. PGA complies with the requirements of USP and EP, which render the thread extremely soft and smooth and knots safe. wherever absorption is required, PGA is preferred absorbable suture material in use for ophthalmic surgery.

The material is broken down results in total absorption in approximately 60 to 90 days. Approximately 65% of tensile strength remain after 2 weeks, 35% of tensile strength remain after 3 weeks
